Novel polypeptides and nucleic acids homologous to transmembrane receptor, thymosin, neuromodulin-like family of proteins for diagnosing, trating cancer, atherosclerosis, neurological, skin and autoimmune disorders.

Claim 9a; Page 142; 323pp; English.

The invention relates to 24 novel human proteins designated NOV1-NOV14 (ABB09524), collectively referred to as NOVX proteins, and nucleic acids encoding them (AB093092). NOVX proteins and nucleic acids encoding them (AB093092). NOVX proteins and nucleotides are useful in the treatment, diagnosis or prevention of NOVX cassociated disorders or in the manufacture of a medicament for treating associated disorders or in the manufacture of a medicament for treating cassociated disorders or in the manufacture of a medicament for treating cassociated with Sports of them of the 24 cassociated with Sports of them of the 24 cassociated with NOVX proteins including neurological disorders (e.g., Alzheimer's Huntington's and parkinson's diseases), call sports are associated with NOVX proteins including neurological castor, path, behavioural disorders, addiction, tuberous sclerosis, cancers of e.g., allargies and autoimmune diseases), myasthenia gravis, asthma, various forms of arthritis, diabetes, thyroiditis, cardiovascular disease (e.g., phypertension), reproductive disorates, endometriosis, incontinence, psoriasis, scleroderma, alopedia, ulcers, pancreatitis, incontinence, psoriasis, scleroderma, alopedia, ulcers, pancreatitis, circuminence, psoriasis, scleroderma, alopedia, ulcers, pancreatitis, diabetes, controlers, polycytic kidney diseases, endometriosis, circuminence, psoriasis, scleroderma, alopedia, ulcers, pancreatitis, diabetes, collections and particularly cardiomyopathy, disorders, obesity, bacterial infections and particularly disorders of metabolic pathway regulation. NOVX nucleic acids and polypeptides may of metabolic pathway regulation. NOVX nucleic acids sequences can be used to identify a cell differentiation, of small molecular and part modulate or inhibit processes such can necessure of proliferation of small molecular or probes for forms, or an electivity of NoVX proteins and per dentifying and cloning NoVX homologues in other cell types of NoVX activity. The present sequence represents of prostering

The invention relates to 24 novel human proteins designated NOV1-NOV14 (ABB09501-ABB09524), collectively referred to as NOVX proteins, and nucleic acids encoding them (ABQ93879-ABQ9302). NOVX proteins and nucleic acids encoding them (ABQ93879-ABQ9302). NOVX proteins and nucleic acids encoding them (ABQ93879-ABQ9302). NOVX proteins are useful in the treatment, diagnosis or prevention of NOVX-nucleotides are useful in the manufacture of a medicament for treating associated disorders or in the manufacture of a medicament for treating such disorders, with specific applications described for each of the 24 NOVX proteins, based on their homology to known proteins. Various disorders (e.g., Albrañagre) and about their homology to known proteins. Various disorders (e.g., albrañagre) addiction, tuberous sclerosis, cancers (e.g., albrañagre) and autoimmune disorsess, myasthenia gravis, asthma, various forms of arthritis diabetes, thyroiditis, cardiovascular disorders (e.g., hypertension), reproductive disorders, endometriosis, cardiomyopathy, cincontinence, psoriasis, scleroderma, alopecia, ulcers, pancreatitis, cincontinence, psoriasis, scleroderma, alopecia, ulcers, pancreatitis, disorders, obesity, bacterial infections and particularly disorders atheroselerosis, cell signal processing-related disorders and disorders and cincontinence in section and are also useful as targets for the binds to a NOVX protein, and are also useful as targets for the comprision of small molecules that modulate or inhibit processes such incleic acid sequences can be used to identify a cell of sequences can be used to identify a cell of comprision of small molecules in other cell types. Cells of are useful as a source of primers or probes for forensic biology and for are useful as a source of primers or probes for forensic biology and comprising NOVX mucleic acids are useful and are useful der identifying and cloning NOVX homologues in other cell types. Cells comprising or which and are useful and evaluating and evaluating and contains and fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         138
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   198

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are and the nucleic acids encoding them. The sequences of the invention are cancer in ungy, immune-related diseases and disorders (e.g. breast, colon, lumgy, immune-related diseases and disorders (e.g. restenosis and diseases at thrombosis), brain or neuronal-associated diseases, metabolic coronary thrombosis), brain or neuronal-associated diseases, metabolic cisorders (e.g. disorders, obesity), inflammatory disorders (e.g. disorders, pain, sexual dysfunction, mood disorders, attention disorders, neurological disorders, hypertension, psychotic disorders, neurological disorders (e.g. Alzehmer's disease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also cuseful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. virus (HIV), and mon-viral infections such as ocular disease (e.g. sequences encoding for the novel human proceases of the invention

Sequence 2457 BP; 377 A; 851 C; 797 G; 432 T; 0 U; 0 Other;

Alignment Scores:

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory

                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated Protein Modification and Maintenance (PRM) polypeptides of the invention may be used in the diagnosis, treatment and prevention of disorders associated with decreased expression or activity of PMM. These include gastrointestinal disorders (e.g. Crohn's disease), cardiovascular disorders (e.g. anaemia), cell hypertension), autoimmune/inflammatory disorders (e.g. anaemia), cell proliferative disorders, developmental disorders (e.g. anaemia), cell reproductive disorders (e.g. Alzheimer's disease) (e.g. scabise), meurological disorders (e.g. Alzheimer's disease) vaccine for such diseases. They may also be used in the assessment of the experions compound on the expression of nucleic acid amino effects of exogenous compound on the expression of nucleic acid amino effects of exogenous compound on the expression of nucleic acid and amino and accompanies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        231
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 291

and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        uleuargleuleuglyGlualaThrCysGlnCysleuTyrSerGlnProGlyProPheAs

Prostasin is a trypsin-like the human prostasin-like enzyme activity. Prostasin is a trypsin-like serine protease is useful for immunodetection and for prostasin-like serine protease is useful for immunodetection and diagnosis of micro-metastases, autoimmune lesions and renal failure in chopys speciments, plasma samples and body fluids. The antibody may be used to modulate enzyme activity in a disease, such as metastasis of used to modulate enzyme activity in a disease, such as metastasis of cused to modulate enzyme activity in a disease, such as metastasis of pulmonary disease (CODE), atheroselevosis, neurodegenerative disease (COPE), atheroselevosis, neurodegenerative disease (CoPE), atheroselevosis, neurodegenerative disease (CoECT), atheroselevosis, neurodegenerative provides a cherapeutic target of decreasing human prostasin-like serine provides a ctivity, in particular for treating or preventing metastatic cancer. The agonists and antagonists of the nucleotide sequence may be used to mimic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human prostasin-like serine protease polypeptide and polynucleotide which can be regulated for treating metastasis of malignant cells, inflammation, atherosclerosis, neurodegenerative disease and infections.
                                                                                                                                                                                                                                                                                            Human; prostasin-like serine protease; cytostatic; antiatherosclerotic; virucide; osteopathic; antiinflammatory; vasotropic; neuroprotective; trypsin-like; metastasis; autoimmue lesion; abterosclerosis; gene; canal failure; malignant cell; tumour angiogenesis; enzyme; inflammation; chronic obstructive pulmonary disease; COPD; restenosis; atherosclerosis; neurodegenerative disease; prion protein; infection; amyloid plaque; Grentzfeldt-dakob disease; metastatic cancer; lipid accumulation; osteoporosis; Paget's disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   57
augment and inhibit the enzyme activity which may be useful to treat osteoporosis, Paget's disease and degradation of bone implants particularly dental implants. Altered levels of human prostasin-like berine protease activity inhibits both smooth muscle cell proliferation and lipid accumulation and inhibit the progression of restenosis and atherosclerosis. The nucleic acid sequence is also useful in diagnostic assays for detecting diseases and abnormalities or susceptibility to diseases related to the presence of mutations in nucleic acid sequences which encode the enzyme. The present sequence represents the human prostasin-like serine protease #1 nucleotide sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ĠŦĠĠġĠĊŦŔĠĠĊŦĠĠŦĠĠĠĠŖĠĠĊŖĊĊŦĠŦĊŔĸĠŦĊŦĊŦĸĊŔĠĊĊŔĠĊĊĠĠŦĊĊĊ

The invention relates to primers for synthesising full length CDNA clones. 830 CDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence methods. The sequence was used in homology searches to identify the clone. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             38 CysGlyArgProGluProSerAlaArgIleVal-GlyGlySerAsnAlaGlnProGlyTh 57

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence fiths 5'-end of a cDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROW format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        382
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               202

which can be regulated for treating metastasis of malignant cells, inflammation, atherosclerosis, neurodegenerative disease and infections. By Disclosure; Fig 3; 111pp; English.

This invention comprises the CDNA and protein sequences of an isolated prostasin-like serine protease and reagents and methods for regulating prostasin-like serine protease is useful for immunodetection and care protease purified from human seminal fluid. An antibody specific for prostasin-like serine protease is useful for immunodetection and capanosis of micro-metastases, autoinmune lesions and renal failure in bloopsy specimens, plasma samples and body fluids. The antibody may be used to modulate enzyme activity in a disease, such as metastasis of used to modulate enzyme activity in a disease, such as metastasis of cused to modulate enzyme activity in a disease, such as metastasis of pulmonary disease (COPD), atherosclerosis, neurodegenerative disease (COPD), atherosclerosis, pagett of disease in mucleotide sequence may be useful to treat administ and antagonists of the mucleotide sequence may be useful to treat augment and inhibit the enzyme activity which may be useful to treat or particularly dental implants. Alexed levels of human prostasion of estention and inhibit the progression of bone implants of atherosclerosis. The nucleic acid sequence is also useful in diagnostic atherosclerosis. The nucleic acid sequence of mutations in nucleic acid sequences cof diseases related to the presence of mutations in nucleic acid sequence (CCCC) which encode the enzyme. The presence of enteriors of the invention so prostasin-like serine protease #2 nucleoride sequence of the invention sequen

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed can divinity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and also assess hadself represent novel human diagnostic and considered the constant when the constant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention describes a method for assessing whether a patient is afflicted with ovarian cancer by comparing: (1) the expression of a marker (1) (see AAF98594 to AAF98730), in a patient sample; and (2) the mormal level of expression of (1) in a control non-ovarian cancer sample, where a significant difference between the level of expression in (a) and (b) is an indication that the patient is afflicted with ovarian cancer. It have expositions and kits from the present invention can be used for: (1) assessing and treating ovarian cancer; (2) making isolated for: (1) assessing and treating ovarian cancer; (2) making isolated assessment; and (3) inhibiting ovarian cancer in a patient. AAF988573 to AAF98593 represent human kinase marker primærs and probes which are used in the exemplification of the present invention
                                                                                                                                                                                                                       1133

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of

contributuse with patients having an enhanced risk of developing covarian cancer (e.g. patients having a familial history of ovarian cancer (e.g. patients having a familial history of ovarian cancer.) The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain cal sorders (e.g. cerebral ocdema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with covarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastrasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the concern at risk of developing ovarian cancer. The present mucleic acid sequence encodes one of the ovarian cancer markers described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.

Claim 1; SEQ ID NO 6286; 44pp; English

The present invention describes a method (MI) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity, and can be used in gene therapy. MI can be used for screening and activity and can be used for producing a product which is anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oseoplageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, clear call cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent neoplastic activity, determining a change in cypression of at least one gene (1) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an activity and can be used for producing a product which is anti-neoplastic agent, and can be used for producing a product which is compreted with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oseophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcer, squamous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GluProAlaAlaGluTrpSerValLeuLeuGlyValHisSerGlnAspGlyProLeuAsp 115
